### Series on Equity

The Region of the Americas, together with the rest of the world, is preparing to face the major challenges presented by the post-2015 sustainable development agenda, whose 17 objectives include health and well-being, the reduction of inequity, and action on a wide range of social and environmental determinants of health. In these times of change, the first of many lessons learned on the road toward achieving—or in some cases, not achieving—the Millennium Development Goals is that the principle of equity is an ethical imperative essential to guiding, informing, and defining political priorities for action on health and well-being.

In keeping with the recommendation of the Committee on Social Determinants of Health to gather evidence, the *Pan American Journal of Public Health* presents a series of reports on Health Equity and Sustainable Development.

The series comprise original, peer reviewed research articles offering generally applicable knowledge on crucial features of the topic at hand, while helping to consolidate the empirical basis for institutional capacity-building aimed at addressing health equity as a key aspect of sustainable development in the Region.
